Mentor,
Web Design & Development – 105 (Jhenaidah)

Learning Platform

We use different platform for different reason. What about merging them together?

We can build a platform for every task that should be done by a student in a classroom like submitting assignment, attending to a class (Live Video), sharing knowledge and other stuffs.

It would be more interesting with some touch with automation. Taking attendance is important. But it's too tough for a teacher to look at every student when they are present and when they are not.

This is the era of Technology and it's not ideal to waste time by taking attendance and watching whether a student is present or not. It can be done by automation.

Zoom provides API with documentation and attendance can be automated (with timetable and every detail needed) to watch students perfectly and bind it with the learning platform to easily implement and it create a great opportunity to make the best use of time.

Also, the assignment submission counting, total numbers counting, warning with email / messages can be also done with the third-party messaging API. So, teachers and students will get the best opportunity to teach and learn easily without worrying about attendance, marks and other stuffs.

Also, it will be benefitted for making the best use of time and it will minimize the extra tension and thinking about managing all the stuffs because the teachers don't have to use different platforms for different tasks, exams, taking classes, all will be gathered to one platform.

Please consider my English. Thank you, Sir, for giving me this opportunity to express my thinking and helping me making my dream come true. Pray for me.
